Alternative Fabric Supports
for the Dacron Lining Technique for Paper Objects

ABSTRACT

The Dacron technique for lining paper objects was described in the conservation literature in the first volume of the Book and Paper Group Annual. Dacron lining is one of a number of methods used to line paper objects and dry them under tension. An advantage of Dacron lining is its suitability for large paper objects such as wall maps. The size limitations depend on the dimensions of the Dacron available and that of the table/rigid support. The method can be used where extra care is needed to keep tear edges aligned. It works well when lining an artifact with losses where uneven pressure during drying can be problematic. Artifacts lined in this way become particularly flat; therefore this must be the desired effect.

In the past few years, it has been noted that the Dacron that is offered in supply catalogs differs from the original product used when this technique was first described. The original Dacron had a smooth surface that readily released from the Japanese paper lining once drying was complete. The new Dacron has more tooth and can cause damage to the lining paper during release. For this research project, the efficacy of different fabrics was tested in order to find an alternative to the original Dacron. A summary of the technique, its advantages and disadvantages are presented. A survey of paper conservators and textile suppliers determined which fabrics to test. Examination and testing included adherence to the rigid support and lining paper and subsequent ease of release from the lining paper. Finding an alternative fabric will ensure that this valuable lining method does not disappear from the conservator’s repertoire of techniques.

INTRODUCTION

The Dacron lining technique had been successfully used by the authors on numerous occasions, primarily in the lining of oversize maps. However, attempts to use this technique with the new version of Dacron were found to be unsuccessful. The lining paper stuck too firmly to the Dacron such that removal proved potentially dangerous to the object being lined. Alternative fabric sources for this useful technique were investigated. Literature and internet searches were done to investigate the technique and variations. The technique was first described by Gary Albright and T.K. McClintock in the Book and Paper Group Annual, 1982. It was then listed as a possible lining technique in the Paper Conservation Catalog, Chapter 29. A few discussions on the Conservation DistList mention the difficulties in finding the “Original” Dacron. Suggestions for alternatives included using the “New” Dacron with a Hollytex intermediary or using a filament polyester taffeta.

Seven fabrics were chosen to test the Dacron lining method. The qualities needed to replicate the “Original” Dacron were as follows:

- good adherence to the rigid support to retain tension while drying
- good adherence to the lining paper
- easy removal of lining paper from fabric
- upon removal, fabric should not impart a texture/pattern to the lining paper

Two samples of the “Original” Dacron that had been used successfully for many years were used as the controls. The newer version of Dacron, purchased through Testfabrics, Inc. was tested alone and with the use of Hollytex as an intermediary layer between the “New” Dacron and the lining paper. Three additional fabrics were chosen from the Testfabrics, Inc. catalogue that had similar characteristics to the “Original” Dacron, Filament Polyester Oxford Weave (Style 749), Polyester Taffeta (Style 738) and Baumann Unilargo 100% Polyester plain weave.

Two different Japanese papers were used for the linings, Hiromi Sekishu R-014 Extra thin and Paper Nao RK-27. The two papers were chosen to replicate a lining of a small

Alternative Fabric Supports for the Dacron Lining Technique for Paper Objects

Cuoco and Hamilton

**RESULTS AND CONCLUSION**

The fabrics tested varied in their efficacy as lining supports. They varied in terms of adherence during drying and release after drying was complete.
Adherence

While all of the fabrics adhered well to the Plexiglas drying board, some did not adhere well to the Japanese lining papers. The Baumann fabric, for example, did not adhere to the Japanese paper (fig. 8). The lined item released from the Baumann fabric and became severely cockled. Such a lining could potentially cause serious damage to an artifact. The Polyester Taffeta adhered well to the heavier, RK 27 lining paper, but the thinner Sekishu released and cockled slightly.

Release

Some fabrics could not be safely removed from the lining paper. When the fabric was separated from the Japanese paper using a large Teflon spatula, the paper was severely skinned. The “New” Dacron, as well as the “Original” Dacron, pink, behaved in this way (fig. 9).

Recommended Fabrics

Three fabrics performed well both in terms of adherence and release. They adhered well to the Plexiglas board during drying but released with careful use of the Teflon spatula. These fabrics can be recommended for use. The second and third fabrics listed can be purchased from Testfabrics, Inc.

- “Original” Dacron, white—This fabric is no longer available for purchase or is difficult to find.
- “New” Dacron with Hollytex—Please note that without the Hollytex, this fabric actually damaged the Japanese lining paper.
- Polyester Oxford Weave

ACKNOWLEDGEMENTS

We would like to thank The Weissman Preservation Center, Harvard University for their support during this project, James Reid-Cunningham, Head of Conservation, Boston Athenaeum for his suggestion of the Hollytex method and Walter Newman, Director of Paper Conservation, NEDCC for the loan of the “Original” Dacron.
